

'IT Security for e-Health' Workshop: 4th Sept 2009

Mobilegov Access Control

Lab Lateral / Mobilegov

The Challenge or problem –

Providing patient self service applications and distributed access to patient information online requires a high level of user security which has previously been uneconomical

Primary interests –

To understand the current challenges faced by the NHS in providing secure access to Patient records and systems.

To understand how Mobilegov and Lab Lateral can work more closely with the NHS to deliver organisational efficiency through better use of web technology

The Approach to address the Challenges –

Allow users to define their own hardware token eliminates the majority of organisational costs whilst providing strong security.

Mobilegov Access Control facilitates the provision of large scale web based systems that enable NHS Trusts to leverage secure and efficient systems for patient self service and clinician access

Goals in attending workshop –

An opportunity to share our knowledge in strong authentication for web based access to confidential systems and data.

Further expand our NHS contacts with whom we can cooperate to facilitate innovation
